Verdermag

Mag Drive Centrifugal Pumps

The series of mag drive centrifugal pumps from Verder consists of a wide range of both metallic and non-metallic pumps. Verder has more than 40 years of experience in mag drive centrifugal pumps and is an expert in choosing the most adequate pump for your pumping application.

The Verdermag series of pumps comprises the metallic Global and the non-metallic heavy duty TB, U, V&W series and the normal duty V-MD, GPMD and GLMD versions. The Verdermag range is therefore a complete, well-balanced series of magnetically coupled centrifugal pumps.

As with all series of Verdermag centrifugal pumps, emphasis is on maximum interchangeability and quality improvements, hence all products are covered by a two-year guarantee, as well as the standard Verder warranty package.

Features and advantages

- Simple by design - Fewer parts are used in the whole pump than most conventional seal cartridges ensuring easy maintenance and assembly
- Mag drive coupled: completely leak free

Mag drive centrifugal pumps are being used in a wide range of industrial areas:

Chemical industry

Acrylic acid, 50% aluminum chloride, hydrofluoric acid 50%, hydrogen sulfide, 85%, sulfuric acid, 98%, ammonia, phosphate and many others

Electronics industry

Plating, etching, ferric chloride, hydrochloric acid 37%, sodium hydroxide 50%

Mining

Brine with uranium solids, H₂O, soda ash, HCl

Galvanic industry

Plating, etching, filtration

Pharmaceutical industry

Sodium hydroxide 50%, caustic soda, hot oil, solvents

Steel industry

Hydro chloric acid, pickling liquor, sulfuric acid

Working principle

Although each mag drive pump series -depending on its design- has its own characteristics, all mag drive pumps work with a magnetic coupling.

The principle of a magnetic coupling

A magnetic coupling consists of two magnet assemblies. One is the outer assembly (the drive magnet) and the other is the inner assembly (the driven magnet). The outer assembly is connected to a motor and the inner assembly is directly or indirectly attached to a pump impeller. As illustrated, at rest, the magnet components of the outer assembly are aligned with their counterparts in the inner assembly. When load (torque) is applied, the coupling deflects angularly and the magnets create a force of simultaneous attraction and repulsion. This force is used to transfer torque from the motor to the impeller.

This permanent magnet coupling creates neither slippage nor induction currents during rotation. If excessive torque is applied, the magnets will de-couple. The magnets will not re-couple unless the pump is stopped. There is no energy loss in a permanent coupling unless an electrically conductive containment is placed between the outer and inner magnets. If an electrically conductive material is used for the containment, Eddy Currents will be generated which will cause some energy loss.

OVERVIEW OF PUMP SERIES

Series V-MD

The wide choice of V-MD pumps is based upon the most common OEM requirements for optimum flow and head characteristics. At least 10 models are available in PP and/or E-TFE. The major advantage for using the V-MD pumps is total product containment; no unexpected leakage. Connections are hose design or threaded.

Flow range up to 100 l/min

Heads up to 14 m

Series GPMD and GLMD

The GPMD and GLMD series are mid capacity mag drive pumps with a very good price/quality relation. The pumps are available in PP and ETFE (GPMD) and in ETFE lined cast iron casing (GLMD). In general design the GPMD and GLMD models do have some interchangeable parts when comparing ETFE built versions.

Flow range up to 1500 l/min

Heads up to 40 m

Series TB, U and V&W

Verder offers you the newest mag drive series, with thrust balancing (TB series) and universal purpose pumps (U series). Also available is the V&W series, based upon the TB series, vertical inline pumps with the same benefits and features as the TB series. The patented Thrust Balancing Design eliminates axial thrust bearings and provides the basis for a controlled internal environment. This design minimizes the issue of secondary containment by providing secondary bearings.

Flow range up to 300 m³/h

Heads up to 110 m

Series GPSP

The GPSP self priming mag pump is a high quality mag drive centrifugal pump with best efficiency and fastest working duty points. Model GV is constructed of PP (housing material) whilst model GV(F) is constructed of ETFE. Material choice on bushing and O-ring is carbon/FPM, ceramics/FPM or PTFE/FPM to provide utmost application possibility.

Flow range up to 440 l/min

Heads max. 26.5 m

Series Global

Metallic mag drive series with great possibilities to cover requirements according to ISO 2858, high pressure system Pumps, and more basic pumps (style 1 Models).

Flow range up to 70 m³/h

Heads up to 100 m

VERDERMAG V-MD SERIES

The V-MD OEM mag drive pumps

A very compact, mag drive centrifugal pump. Dependent on the application these pump series can be supplied with either closed or open impeller. The electric motors are completely integrated and are fed with a power supply of 230/240 V, 50 Hz. All types can be supplied with threaded or hose connection.

The wide choice of V-MD pumps is based upon the most common OEM requirement for optimum flow and head characteristics. The major advantage for using the V-MD pumps is total product containment; no unexpected leakage. Even for flows up to 100 l/min the models are still compact due to the close coupled electric motors. The process connections are standard hose design, but the larger models in particular can also be supplied with threaded connections. Motor specifications are standard single phase (100–110 V and 220–240 V), 50 to 60 Hz for use worldwide. For optimum efficiency and lower heat input the smaller models can be operated with DC drives. The maximum voltage is 24 V, this results in an operating speed of 4.000 rpm. This is much higher than the 2.500 rpm at 50 cycles with AC drives.

Features and advantages

- Total product containment
- Excellent for OEM requirements in flow and characteristics
- No leakage
- Compact but very reliable
- Small pump with gigantic possibilities
- UL-VDE approved

Applications

- OEM
- Chemical processing
- Metal plating
- Parts washing
- Circuit boards
- Photo processing
- Pharmaceuticals
- Food processing

VERDERMAG GPMD and GLMD SERIES

The GPMD/GLMD models are mid capacity mag drive pumps with a very good price/quality relation. The pumps are available in PP and ETFE (GPMD) and in ETFE lined cast iron casing (GLMD). In general design the GPMD and GLMD models do have some interchangeable parts when comparing ETFE built versions.

Most major storage of concentrated chemicals is done in tank farms, located outside of the production facilities for safety and logistical reasons. The GLMD/GPMD pumps are used to pump these liquids into the plant, where the liquids are used for production. The majority of liquids are: acids, like hydrochloric acid, sulphuric acid, nitric acid, phosphoric acid and bases, like sodium hydroxide, potassium hydroxide etc. from virtually zero to full concentration.

Model GPMD

The GPMD model is available in both polypropylene and ETFE and is notable for its solid plastic front casings. The process connections are standard threaded flanged with slotted holes to accommodate DIN, ANSI and JIS contra-flange specifications. Thread connections are available as well. The polypropylene components are injection moulded with glass fibre reinforcement, the E-TFE material is reinforced with carbon fibre. Most chemicals can be transferred with these material options.

Model GLMD

The stationary ceramic shaft design avoids complex internal design, as the single sleeve bearing is fitted into the internal magnet. The standard material for this sleeve bearing is high density carbon, this has self-lubricating possibilities if process flows are reduced. The front- and rear casing are sealed by just 1 static o-ring in Viton. The injection moulded ETFE components, such as front casing liner, rear casing, impeller and internal magnet are reinforced with 20% carbon fibre to give optimum strength and temperature resistance. The maximum liquid temperature limit is therefore 90°C.

Technical specifications

	GPMD	GLMD
Flow range	1300 l/min	1500 l/min
Head	up to 30 m	up to 40 m
Temperature	up to 90 °C	up to 90 °C
Operating temp.	max. 6 bar	max. 6 bar
Power supply	up to 11 kW	up to 11 kW

Features and advantages

- Suitable for most chemicals
- Standard is threaded flange with slotted holes (thread only connections can be offered upon request) for GPMD, Metal-lined casing with fixed flanges (GLMD)
- Main sealing through only 1 static o-ring in Viton® (optional EPDM)
- Standard installed carbon graphite for the single sleeve bearing (optional SiC and ceramic)
- Max. of 0.5% of solids by volume
- Particle size should be limited to 50 microns
- Eddy Current losses of max. 2% (GLMD)
- All units are close coupled
- Magnet coupling of Samarium Cobalt (> 4 kW at 50 Hz) or Barium Ferrite (< 4 kW)

Applications

- Chemical industry
- Pharmaceuticals
- OEM
- Tank emptying
- Food processing

VERDERMAG TB, U and V&W SERIES

As a result of thorough research and cooperation with the best technical designers Verder can now present you the newest mag drive series, with thrust balancing (TB-series) and universal purpose pumps (U-series). Also available is the V&W series, based upon the TB series, vertical inline pumps with the same benefits and features as the TB series.

The patented Thrust Balancing Design eliminates axial thrust bearings and provides the basis for a controlled internal environment. This design minimizes the issue of secondary containment by providing secondary bearings.

Working principle

The single, enclosed impeller/magnet assembly is free to rotate and slide on the central cantilevered shaft. The main flow of liquid enters the impeller (1) and is pressurized and then expelled into the volute (2) and out the discharge. A small portion of the flow passes behind the impeller and through the back wear ring clearance (3) and then into the balance chamber. This liquid then flows through, past the bushings (4) to exit at the valve (5). If the impeller moves forward, the valve is opened to a greater degree and the balance chamber pressure is reduced. This causes the impeller to react with a net force towards the motor. However, the valve is now closing and the balance chamber pressure increasing. This moves the impeller towards the suction. The net result is a very stable axial position for the impeller. There are no axial bearings and the radial bearings always operate in a pressurized fluid environment.

OVERVIEW OF PUMP MODELS

Model TB

Model TB offers with 3 impeller sizes and in total 14 suction/discharge configurations a tremendous flow range to meet with all your requirements. With SiC as standard material, and patented thrust balancing and wear rings that work as a secondary bearing, this pump is suitable for pumping solids in the liquid. These series is an advanced mag drive pump for all heavy duty pump applications for best economic prices.

Model U

Engineered with the same robust constructions as the TB model, these pumps are perfect for low flow chemical transfer, scrubber applications and high purity chemical services. Pure Teflon PFA or Carbon inforced Tefzel combined with SiC or Carbon Graphite offer best universal chemical resistance in the dirtiest or most pure applications.

Models V&W

Models V and W are an extension for the TB model, with the same unique properties and features, but designed as an in-line pump.

Features and advantages

- Suitable for volatile liquids using non-metallic mag drive technology
- Thrust balanced impeller; no axial bearing problems during low suction operation even with severe cavitation or entrained air in the fluid
- Increased pump reliability and pump life because of balanced impeller
- Standard SiC replaceable wear parts
- Particles cannot enter containment shell of inner magnet gap
- NPSHr is equal to standard sealed pumps
- BEP's are equal to standard sealed pumps
- One bolt size only – simplifies maintenance
- Wear rings work as secondary bearing to protect impeller/inner magnet assembly
- Very good price-quality combination

Pumping Solids with models TB

The back wear rings filter the solids from the fluid, resulting in a clean, filtered liquid used for cooling and lubrication of the inner magnet, bearing and shaft. Max particle size = 3.2 mm.

Special features

Containment shell

Features and advantages

- One piece molding of carbon fiber-reinforced ETFE or PFA
- Containment shell reinforced with a Aramid/Vinyl ester composite, burst pressure > 200 bar
- Reinforces shaft socket
- Front face houses stationary SiC wear ring
- Internal ribs limit swirl
- Optimum combination of pressure and shock resistance
- Able to handle any combination of radial loads
- No heat generation and max. possible efficiency
- Zero Eddy Current losses
- Fast ejection of fine particles from containment shell

Single piece impeller

- Molded one piece enclosed impeller made of carbon fiber-reinforced ETFE or PFA
- High strength neodymium iron boron magnet assembly
- Maximum size magnets in every impeller
- Double welded magnet assembly, preventing permeation
- High efficiency
- Fully open impeller eye
- Hermetically sealed from the environment
- Low NPSHr impeller geometry
- No shaft socket or support struts
- Radial bearings and trust control valve

Special materials selection

- A great pump needs great materials. Verdermag TB mag drive pumps have many specialty materials to create a marvelous pump
- Fluoroplastics
- For the ultimate in chemical and corrosion resistance Verder uses only the highest grade of fluoroplastic resins. ETFE, PTFE and PFA. All inside surfaces of TB pumps are made of fluoroplastics. This includes injection molded impellers and containment shells right down to rotationally molded pump lining

Composites

All Verdermag TB containment shells are made with Aramid fibers for the ultimate in burst resistance. Excellent water hammer resistant (ratings +200 bar).

Alpha sintered Silica Carbide

A grade of ceramics which is simply the best, chemically inert, extremely hard and wear resistant. Standard material for the shaft and bearings in TB pumps.

Custom accessories

- Steam heat jackets
- Low flow models to save energy
- Direct mount engine driven options for tanker trucks and remote locations

	TB	U	V, W

VERDERMAG GPSP SERIES

In cooperation with worlds' best technical designers Verder now can present you the fastest suction with the most advanced self priming pump technology. Where space savings are important or when you don't have a flooded suction, the Verdermag GPSP offer solutions in a large variety of applications. Furthermore the Verdermag GPSP series have the fastest suction in the world (5.5 m/ 2 min.)

Models

The GPSP series self priming mag drive pump is a high quality mag drive centrifugal pump with best efficiency and fastest working duty points. Model GV is constructed of polypropylene (housing material) whilst model GV(F) is constructed of E-TFE.

Material choice on bushing and O-ring is carbon/FPM, ceramics/FPM or PTFE/FPM to provide utmost application possibility.

Features and advantages

- Worlds' fastest suction
- Air lock / cavitation free construction
- Prevented and resistant to dry running
- Patented valveless mechanism
- Patented heat resistant bushing
- Compact, simple construction
- Easy replacement of wear parts

VERDERMAG GLOBAL SERIES

A combination of the latest materials and engineering practices, coupled with Verder's 50 years' experience in manufacturing synchronous magnet-driven seal-less pumps, has created a flexible range of pumps ideally suited to modern requirements. Tried and trusted designs have been updated to allow modular construction, with many interchangeable components. The pumps can be assembled from stock components to give quick response times, whilst spares requirements are kept to an absolute minimum.

The Global pump utilises the differential pressure generated by the pumping action to create a flow around the bearings and magnets. The pumped liquid acts as a cooling medium to dissipate the heat generated from Eddy Currents as the magnets pass around the containment shell. It is also used to lubricate the hydrodynamic bearing sets, with flow from the front bearing passing through the balance holes of the impeller and flow around the rear bearing re-entering the low pressure suction area of the volute.

Specialist in-house engineering capabilities allow Global to offer a wide range custom made products, covering extended flow ranges, temperatures and pumps required for use in high system pressure applications.

Features and advantages

- Simple by design - fewer parts are used in the whole pump than most conventional seal cartridges ensuring easy maintenance and assembly
- Bearings - top grade silica free silicon carbide - fitted as standard for its chemical resistance to most reagents. An added benefit is its exceptional hard wearing capabilities.
Only 4 bearing sizes cover the entire Global range
- Press fit bearing design - bearings are seated on static O-rings, to absorb small movements and temperature shocks, ensuring consistently high performance and easy fitting
- O-rings – gaskets are specially chosen to suit the customer's specific requirements. High temperature perfluoro-elastomers o-rings, such as Kalrez, Perlast or Chemraz are available; these extend the pump capability up to +250 °C
- In-house engineering capability allows for specialist pumps to be developed for specific applications
- The Verdermag Global series can also be ATEX marked, making them ideal for the petrochemical industry
- Top grade rare earth samarium cobalt magnets are fitted as standard on all pumps making high temperature applications easy

OVERVIEW OF PUMP MODELS

Style 1

A range of close coupled pumps covering low flow and head requirements, with power outputs from 0.55 – 4.0 kW.

MII

This range is manufactured according to ISO 2858 at the hydraulic end with close-coupled drive connection, covering a wide range of flow and heads, with power outputs from 3.0 – 30 kW.

High System Pressure Pumps (HSP)

A range of pumps for system pressures of up to 200bar, with power outputs from 0.75 – 11 kW.

Applications

- Chemical processing
- Tank farms
- Re-circulation duties
- Thermal oil heat transfer
- Sampling systems
- Pharmaceuticals
- Special chemicals
- Oil and offshore

In addition custom made pumps are manufactured in exotic alloys, such as, Hastelloy, Inconel, Titanium or Duplex.

Technical information

	Style 1	M II	HSP
Flow range	1-25 m ³ /h	5-150 m ³ /h	1-70 m ³ /h
Head	up to 40 m	up to 100 m	up to 100 m
Temperature range	-20 to 200 °C**	-20 to 200 °C**	-20 to 200 °C**
Operating pressure	16 bar*	16 bar*	up to 200 bar
Test pressure	24 bar	24 bar	up to 300 bar
Power supply	4 kW	30 kW	11 kW

* Engineered products available outside these ranges. Pump will be de-rated for high temperature considerations applications in accordance with appropriate pressure vessel and flange standards

** Down to -100C and up to 250 °C with correct O-ring/material options

VERDERMAG MODEL STYLE 1

Model Style 1

This range of pumps is suitable for lower duties than covered by the ISO 2858 (MII) pumps.

They offer a low-cost option for low flow and head duties and are available from stock.

Features and advantages

- Hydraulic pump end with standard casing and fabricated casing bowls with centerline discharge
- Single bearing design for increased reliability
- High level of interchangeability for spare parts
- Optional: Universal, PN16 or ANSI 150.lb. flanges
- Close coupled motor fitment, no need for re-alignment on commissioning and after servicing

VERDERMAG MODEL MII

Model MII

This Range of ISO 2858 standard pumps, offers a medium to high flow and head duties. Many of the medium flow and heavy duty pumps are available to assemble from stock components.

Features and advantages

- According to ISO 2858
- Twin bearing design for superior operation
- Modular design: high interchangeability of spare parts
- Alternative joints and elastomers are available
- Casing can be supplied with PN16
- Close coupled motor fitment, automatically aligns rotating parts and eliminates the need for re-alignment on commissioning and after servicing
- Thermocouple probe connection to back plate to permit bearing temperature to be monitored
- Heating / cooling jackets to back plate and/or casing

L, AD, KK are depending on motor frame size and motor brand.

Model HSP

The HSP range of pumps excels in areas where leaks are unacceptable. These pumps are particularly effective in applications where chemicals are pumped at high pressures.

Features and advantages

- Hydraulic pump end with standard casing and fabricated casing bowls with centerline discharge
- Single bearing design for increased reliability
- High level of interchangeability for spare parts
- Customer requirements for material, testing or coatings

oxide
Cleaning liquid

Tank unloading

Sulfuric acid, 85%
Sulfuric acid, 93-98%
Acids and caustics

Utility

Sulfuric acid, 93%

Vaccines manufacturing

Methallyl chloride 100%

Washing streets

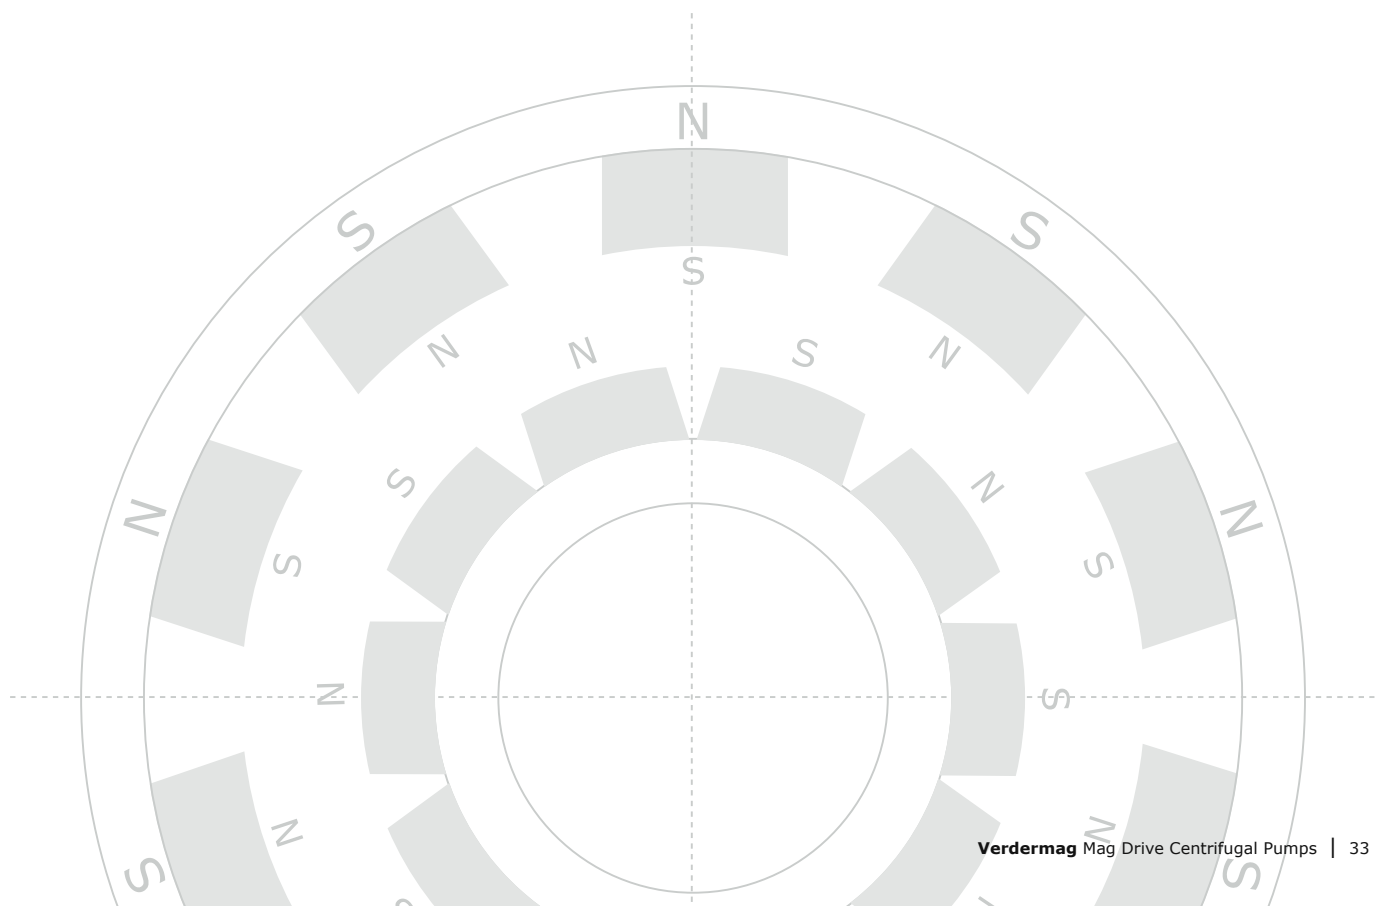

Soap solutions

Waste treatment

Acids

Water and sewage treatment

Acids
Caustic soda
Hydro chloric acid

Verdermag

Passion for pumps

Liquids handling is the original passion of Verdermag.

Its liquids handling companies supply a wide range of first-class pumps for a variety of industrial purposes.

Verder Liquids is active in many industrial sectors: chemical and process industry, food, pharmaceutical, water treatment, and environmental industries.

Within these industries pump requirements vary enormously and applications and needs change frequently. In order to ensure we provide the best solutions. We analyse and monitor industrial trends as well as maintaining close relationships with our customers.

International presence

The Verder Group Liquids division has affiliates in:

Austria - Belgium - China - Czech Republic - France - Germany
Great Britain - Hungary - Netherlands - Poland - Romania - Slovakia
South Africa

Your advantages

The advantages of working with us are clear, we offer you:

- single-source solutions: Verder's wide and complementary range of pumps allows you to source your entire pumping needs from one company, reducing your costs;
- expertise: years of providing pumping solutions to industry have given us valuable expertise and knowledge which we are able to use to supply the most appropriate and reliable pumps;
- international affiliated company: our size gives you the confidence that you are dealing with a powerful international pump company and if your project involves overseas work then you can profit from our international network of companies.

Contact Verder

If you would like to know more about our pumping solutions then please visit our website www.verder.com/liquidshandling.

You will find the full range of our pump ranges as well as application stories, latest news and the contact details of our local specialist.

Verdermag
Any mag drive you want
we got it

Any questions? You may still have questions and/or comments after reading this brochure. Please feel free to contact us on +32 (0)3 877 11 12. You can also respond via email to info@empo-verder.be For more information about Verdermag please visit our website www.empo-verder.be/liquidshandling
